## Melamine Compliance STATEMENT

### Background:

Melamine is an organic-based chemical used in the manufacturing of plastics to give them a harder, more durable feel. Between 2007 and 2008, melamine became a concern when household pets and infants became ill due to the high amounts of this chemical in their food. In response, the Food and Drug administration (FDA) released a guidance document entitled "Pharmaceutical Components at Risk for Melamine Contamination" on August 6, 2009. This guidance alerted pharmaceutical manufacturers of finished products, pharmacy compounders, re-packers, and suppliers to the potential risk of melamine contamination in pharmaceutical components.

### GeminiBio Statement:

GeminiBio does not manufacture API or final drug products but does serve the pharmaceutical industry with ancillary reagents used in the manufacture of drug products and takes seriously the health risks that Melamine can cause. To the best of our knowledge, Melamine and melamine-related components are not primary raw materials or components, nor are they intentionally added or introduced during the manufacturing process and are not a component in the raw materials that GeminiBio purchases from our suppliers.

Robert Perry
